## **Introduction and Site Conditions**

This project consists of a proposed Center for Innovation and Active Citizenship at The Frederick Gunn School in Washington, CT. Refer to Figure 1, Site Location Map, in **Appendix A**.

The project includes the demolition of the existing Math & Science Building, as well as construction of the new approximately 24,000 square foot building with accompanying site improvements. These site improvements include proposed sidewalks, stairs, patios, and driveway reconstruction. Additionally, the project will feature new site utilities to serve the proposed building including underground electric service, propane service, tel-data, domestic water, fire protection, site lighting, sanitary sewer, drainage and stormwater management systems.

### **1.1 Existing Conditions**

The project site lies on the approximately 21.7-acre main campus parcel of the Frederick Gunn School, near the intersection of Green Hill Road (State Route 47) and Roxbury Road (State Route 199), in Washington, CT. The project limits is currently developed with two buildings: the existing Math & Science building and the Elizabeth Kempton Memorial Building. The site area also features various surface features consisting of parking, access drives, walkways, stairs, landscaping, and rock outcrops.

### **1.2 Proposed Conditions**

The proposed work includes the construction of a new approximately 24,000 square foot Building, with a ground floor footprint of approximately 13,000 square feet. Accompanying site improvements include proposed sidewalks, patios, along with reconstruction of driveways and parking areas. The proposed work avoids disturbing existing native trees, rock outcroppings, and landscaping to extents feasible.

Utility improvements on-site include new drainage structures, piping, and stormwater management systems to treat, infiltrate, and release runoff off-site. Ultimately, the stormwater management design is proposed to reduce peak flows and volumes off-site in comparison to existing conditions.

Additional utility work includes proposed tel-data, fiber, electric services, including proposed a new generator and transformer. A buried propane tank is proposed along the driveway on the west side of the new building. Domestic water, fire protection, and a new hydrant is proposed to extend from the proposed building, following the existing driveways, to tap into the existing water system distribution line on campus to the west of the building. The building's sanitary service is proposed to connect to the existing on-campus sanitary sewer system, mimicking the connection of the existing building being demolished. A geothermal system is proposed in the lawn area north of the proposed building.

---

## Section 2

# Stormwater Management

### 2.1 Existing Site Hydrologic Analysis

In general, the project site consists of existing buildings and accompanying sidewalks, driveway, and parking lot which slopes from the northwest to the east, splitting around the existing Math & Science building. A portion of the runoff is directed into storm drainage structures and piping which drains off-site to the existing drainage system in State Route 47 (Green Hill Road) north/upstream of the intersection with State Route 199 (Roxbury Road). The remaining portion of the proposed site area drains to State Route 199 (Roxbury Road) via existing on-site piping which connects to the existing drainage system in State Route 199 (Roxbury Road), as well as by surface flow to the State Route 199 Right-of-Way.

For this project, two analysis design points were chosen downstream of the project area. The first point, Design Point 1, is located at an existing storm pipe which collects runoff from the northern and northeastern portion of the site. Design Point 2 is the property boundary at the southeast of corner of the site which includes runoff from storm drainage piping and also runoff from the site wall which passes through weeps in the wall. See "Existing Watershed Map," **EX-WS**, in **Appendix C** for the locations of the design points, and the corresponding watershed areas.

Impervious and pervious areas, weighted curve numbers, and times of concentration were calculated for each watershed and entered into a hydrologic model to determine the existing condition's peak flow and volume as part of the comparative hydrology analysis.

The soil types were identified and classified using the USDA Natural Resource Conservation Service, Online Web Soil Survey. Using this data, curve numbers, or CN values, were determined by evaluating land uses within the watershed, and then taking a weighted average. The calculated CN values are shown in **Appendix C**.

A breakdown of existing volumetric hydrographs, and existing watershed map are included in **Appendix C** of this report.

#### 2.1.1 Floodplain Management

The Federal Emergency Management Agency's Flood Insurance Rate Map (FIRM) for the Town of Washington, effective September 30, 1992, shows that the site does not fall in a Flood Hazard Area, as shown on the figure in **Appendix A**.

### 2.2 Proposed Site Hydrologic Analysis

The proposed drainage system is designed to mimic the existing drainage watershed, provide stormwater quality measures, and reduce runoff peak flows and volumes leaving the site to less than those in the existing conditions. See "Proposed Watershed Map," **PR-WS**, in **Appendix D** for the locations of the design points, and the corresponding watershed areas.

There are two separate proposed stormwater management systems, correlating to the two separate design points. The first system is comprised of a series of yard drains, associated piping, and a bio-swale. Runoff from the eastern sidewalks, landscaped areas, rock outcrops, and existing buildings are captured by yard drains and directed into the bio-swale. Runoff will then filter through the soil media for water quality treatment, discharge to the on-site drainage system by means of an underdrain, with larger storm events entering the system through the yard drain grate within the bio-swale, and ultimately discharged off-site to the existing drainage system in State Route 47, Design Point 1. This bio-swale is designed with an impermeable liner to mitigate the potential for groundwater to enter the basement of the adjacent existing building. The storage volume beneath the outlet of the bio-swale is 439 CF, greater than the required water quality volume (WQV). The bio-swale treats approximately 0.562 acres of the project area, most of the project area to the east of the building. The bio-swale is designed for the stormwater quality volume of the contributing watershed, and is not accounted for in the computations for mitigating for runoff peak flow and volume. Reduction in the proposed runoff peak flow and volume to Design Point 1 is achieved by nature of reducing the watershed area contributing to this design point in the proposed conditions.

The second proposed stormwater management system utilizes a series of proposed yard drains, manholes, associated piping, hydrodynamic separators, and infiltration chambers. The new yard drains are proposed to capture runoff from the northern and western patio, walkways, landscaped areas and rock outcrops. Runoff from the building roof is piped into the northern infiltration chamber system. The northern and southern infiltration systems are proposed at the same elevations, and interconnected with a proposed 18-inch diameter pipe, nearly flat at 0.1%, to effectively function as one collective system. Infiltration tests were performed at both stormwater management system locations. An infiltration rate of 0.98 feet/day (or 0.49 in/hr) was measured for the northern infiltration area, and an infiltration rate of 5.4 feet/day (or 2.7 in/hr) was measured for the southern infiltration area. The design utilizes half of the measured infiltration rates for each system, resulting in 0.25 in/hr for the northern system and 1.35 in/hr for the southern system. The geotechnical test report is included in **Appendix B** of this report. The infiltration chamber systems were sized to maintain the proposed runoff peak flow and volumes to below those in the existing conditions.

A breakdown of the proposed volumetric hydrographs, proposed watershed map, and calculations for the time of concentrations are included in **Appendix D** of this report.

Table 1 below depicts the reduction in peak flows from existing to the proposed site for the 2, 10, 25, and 100-year storm events.

**TABLE 1**

Stormwater Peak Runoff (CFS)

Discharge Location	Condition	Return Frequency (Years)			
		2	10	25	100
Total Runoff (Design Point 1)	Existing	1.64	3.12	4.05	5.48
	Proposed	1.62	3.02	3.90	5.25
	Change	-0.03	-0.10	-0.15	-0.23
Total Runoff (Design Point 2)	Existing	2.96	5.14	6.49	8.55
	Proposed	2.95	4.88	5.97	8.02
	Change	-0.02	-0.26	-0.52	-0.54

Table 2 below shows the reduction in volumetric runoff from existing to proposed site for the 2, 10, 25, and 100-year storm events.

**TABLE 2**

Stormwater Volumetric Runoff (Cu. Ft.)

Discharge Location	Condition	Return Frequency (Years)			
		2	10	25	100
Total Runoff (Design Point 1)	Existing	6,294	12,141	15,949	21,905
	Proposed	6,199	11,795	15,423	21,086
	Change	-95	-346	-526	-819
Total Runoff (Design Point 2)	Existing	10,341	18,496	23,695	31,746
	Proposed	9,646	17,643	22,736	30,620
	Change	-695	-853	-959	-1,126

A hydrodynamic separator stormwater quality unit is proposed at the northwest corner of the building, just upstream of the first stormwater management system. This structure is located to intercept surface runoff, as well as runoff from the roof, and treat the flow prior to infiltrating or discharging to the south. An additional hydrodynamic separator is proposed at the southwest corner of the building, capturing runoff from the southwestern patios and sidewalks. This water quality unit treats the contributing runoff prior to infiltrating and ultimately discharging to the storm piping and leaving the site. These structures are proposed to capture and treat approximately 0.627 acres of the project area, capturing the building's roof and the majority of the west portion of the site. The hydrodynamic separator models have been selected to exceed the water quality flow (WQF) rate for the contributing drainage area.

Water Quality Area figure and calculations are included in **Appendix E** of this report.

## 2.3 Method of Hydrology Analysis

The following storm drainage design criteria were used:

1. Design storm rainfall data was taken from NOAA Atlas 14 precipitation frequency estimates.
2. Minimum time of concentration = 5 minutes for paved, 10 minutes for grass.
3. For SCS peak flow calculations, Curve Number were as follows:
  - a. Impervious (Pavement/Roof Areas) = 98
  - b. Pervious (HSG B) = 80
4. Water Quality Volume/Flow Calculations based on the 2004 Connecticut Stormwater Quality Manual.
5. Watershed areas delineated using polylines in AutoCAD Civil 3D 2018.
6. Comparative hydrology analyzed using Hydraflow Hydrographs Extension for AutoCAD® Civil 3D® 2018, Version 2018.3 Modeling software.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:12,000.

**Warning:** Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service  
 Web Soil Survey URL:  
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: State of Connecticut  
 Survey Area Data: Version 20, Jun 9, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 23, 2018—Sep 17, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

<sup>1</sup> Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.

**Re: Rock Probes and Water Infiltration Tests, SM & T Center at Frederick Gunn School, 99  
Green Hill Road, Washington, CT**

Dear Kate:

Herewith are the data for rock probes and water infiltration tests performed at the above referenced site.

If you have any questions, please call our office.

Very truly yours,

*Max Welti*

Max Welti, P. E.  
President, Welti Geotechnical, P.C.

M. Welti

Infiltration Tests (using ASTM D6391-11, Test Method B)

Test Location #	Infiltration Rate (feet/day)
IT-1	0.98
IT-2	5.94
IT-3	9.06
IT-4	0.17
IT-6	5.4

Note: No infiltration test was performed at location IT-5. Auger refusal on probable bedrock was encountered at 1.5 to 2.8 feet below the existing grade at that location.

Method 'B' to determine  $K_1$

1 increment = 0.300'

$$K_1 = R_T G \frac{\ln \frac{z_1}{z_2}}{(t_2 - t_1)}$$

$$1 \text{ cm/sec} = 2.834.65 \text{ ft/day}$$

$$G = \left( \frac{\pi d^2}{10} \right) \left( 1 + \frac{D}{4b} \right)$$

$$d = 4'' = 10 \text{ cm} \quad R_T = 1$$

$$d = D = 10 \text{ cm}$$

$$b = 3' = 91 \text{ cm} \quad 4b = 364$$

(Rocket Test = 4')

$$G = \frac{3.14 \times (10.022)}{10} = 2.92$$

Location IT-1

$$z_1 = 99'' = 251 \text{ cm}$$

$$z_2 = 99'' - (125-8) \times 0.300'' = 63'' = 160 \text{ cm}$$

$$\ln \frac{z_1}{z_2} = 0.450$$

$$K_1 = 2.92 \times \frac{0.45}{63 \text{ cm}} = 0.208 \text{ cm/min} = 0.00347 \text{ cm/sec} = 0.98 \text{ ft/day}$$

IT-2

$$z_1 = 105''$$

$$z_2 = 105'' - (120 \times 0.300) = 71''$$

$$\ln \frac{z_1}{z_2} = 0.42$$

$$K_1 = 2.92 \times \frac{0.42}{9.75} = 0.125 \text{ cm/min} = 0.00209 \text{ cm/sec} = 5.94 \text{ ft/day}$$

IT-3

$$z_1 = 98'' = 248.9 \text{ cm}$$

$$z_2 = 98'' - (118 \times 0.300) = 61.6''$$

$$\ln \frac{z_1}{z_2} = 0.46$$

$$K_1 = 2.92 \times \frac{0.46}{7} = 0.19 \text{ cm/min} = 0.0032 \text{ cm/sec} = 9.06 \text{ ft/day}$$

IT-4

$Z_1 = 105'$

$Z_2 = 105 - (5 \times 30) = 97.5'$

$\ln \frac{Z_1}{Z_2} = 0.076$

$K_1 = 292 \times \frac{0.076}{63} = 0.0035 \text{ cm/min} = 0.00059 \text{ cm/hr} = \underline{\underline{0.166 \text{ ft/yr}}}$

IT-6

$Z_1 = 108$

$Z_2 = 108 - (105 \times 30) = 75.6$

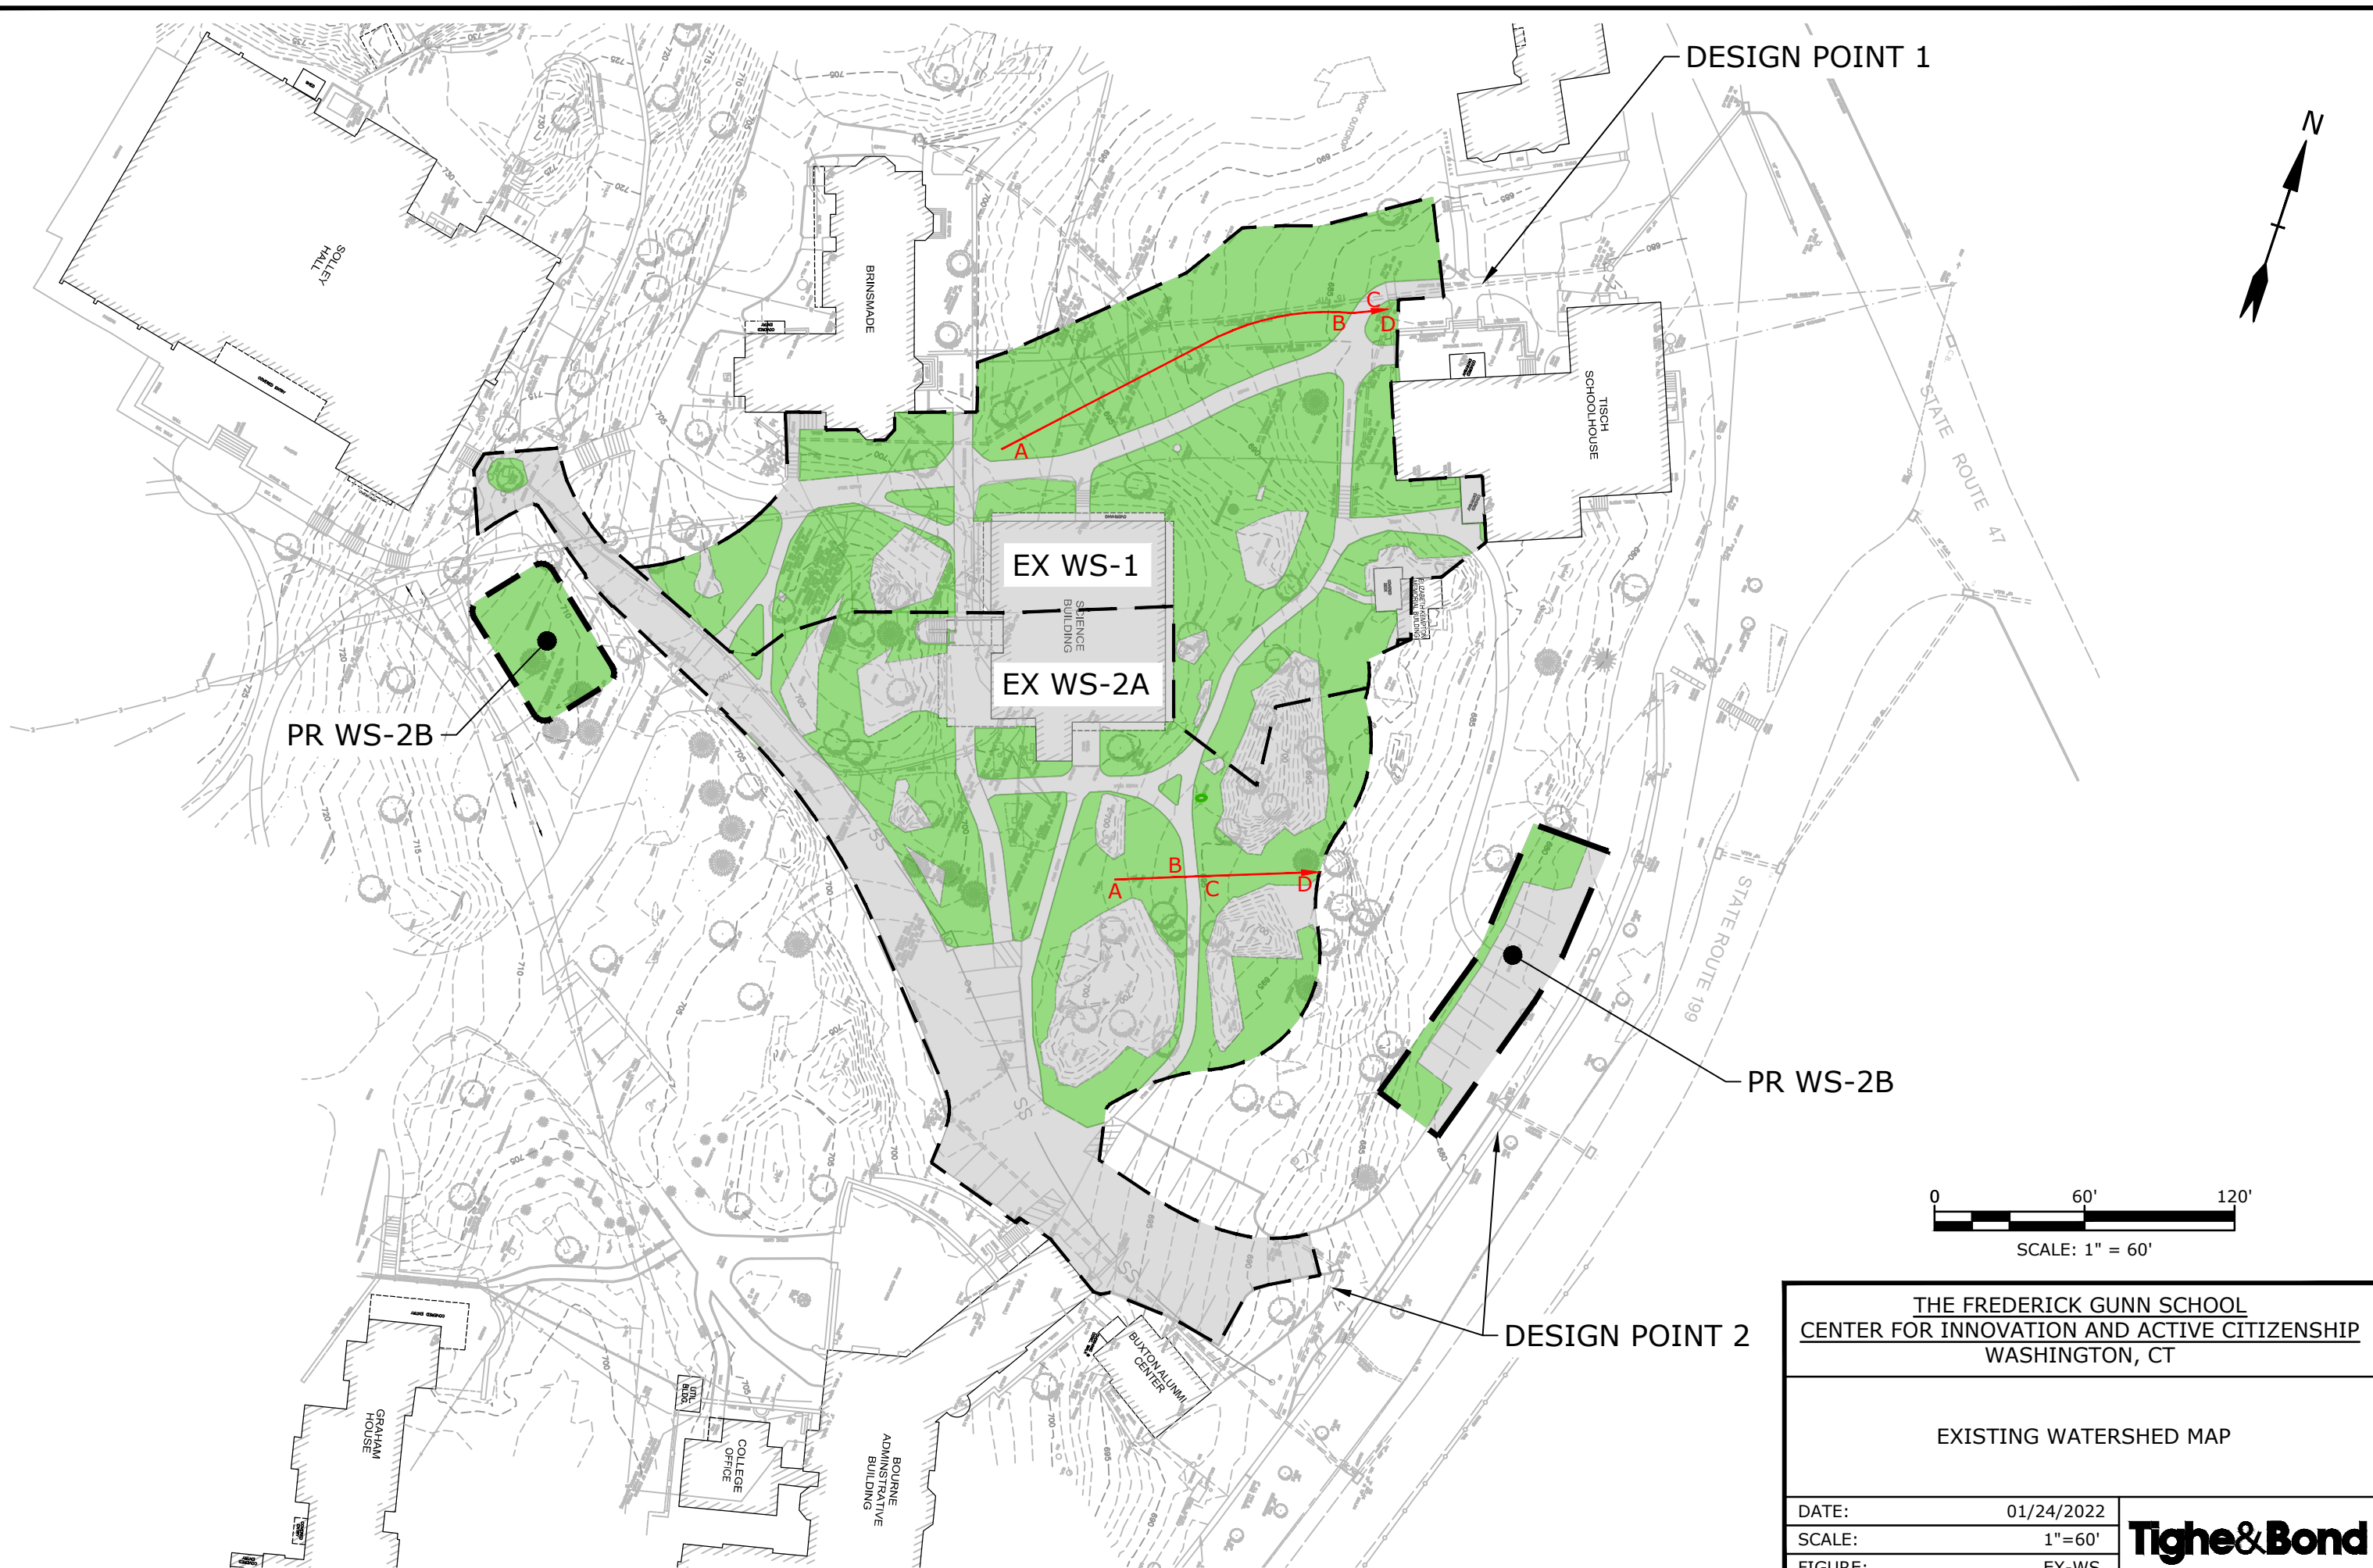

$\ln \frac{Z_1}{Z_2} = 0.355$

$K_1 = 292 \times \frac{0.355}{9} = 0.1146 \text{ cm/min} = 0.001908 \text{ cm/hr} = \underline{\underline{5.4 \text{ ft/yr}}}$

	0.822		70.467

**Weighted CN: 86**

### Time of Concentration

(computed in accordance with ConnDOT Drainage Manual, Sec. 6C)

Overland				
Segment	Surface "n"	Flow Length (ft.)	Slope (ft/ft)	Time (min.)
Segment A - B	0.24	150	0.086	10.85

Shallow Concentrated Flow					
Segment		Slope (ft/ft)	V (ft/s)	Length (ft)	Time (min.)
Segment B - C	paved	0.05	4.55	10	0.04
Segment C - D	unpaved	0.05	3.61	5	0.02

0  
**Total Tc = 10.9 Min.**

Note: Overland time of concentration computed using "Kinematic Wave" equation  
Gutter and pipe time of concentration computed using Manning's equation

Designation: **EX WS-02A**  
Location:

Cover Type	Area, ac	CN	A x CN
Pavement/Roof	0.663	98	65.0139
Landscaped and Lawns	0.331	80	26.4995
	0.995		91.5134

**Weighted CN: 92**

### Time of Concentration

(computed in accordance with ConnDOT Drainage Manual, Sec. 6C)

Overland				
Segment	Surface "n"	Flow Length (ft.)	Slope (ft/ft)	Time (min.)
Segment A - B	0.24	28	0.065	3.17
Segment A - B	0.015	5	0.02	0.14
Segment A - B	0.24	50	0.039	6.18

**Total Tc = 9.5 Min.**

Note: Overland time of concentration computed using "Kinematic Wave" equation  
Gutter and pipe time of concentration computed using Manning's equation

Project Name: **The Frederick Gunn School -  
Center for Innovation and Active Citizenship**  
Project Number: **G5012-002**  
Project Location: **Washington, CT**  
Description: **Proposed CN & Tc Calculations**  
Prepared By: **AVC** Date: **January 24, 2022**

Designation: **PR WS-01**  
Location:

Cover Type	Area, ac	CN	A x CN
Pavement/Roof	0.283	98	27.7397
Landscaped and Lawns	0.495	80	39.6198
	0.778		67.360

**Weighted CN: 87**

**Time of Concentration**

(computed in accordance with ConnDOT Drainage Manual, Sec. 6C)

Overland				
Segment	Surface "n"	Flow Length (ft.)	Slope (ft/ft)	Time (min.)
Segment A - B	0.24	125	0.086	9.37
Segment B - C	0.015	10	0.05	0.17
Segment C - D	0.24	5	0.05	0.89

**Total Tc = 10.4 Min.**

Note: Overland time of concentration computed using "Kinematic Wave" equation  
Gutter and pipe time of concentration computed using Manning's equation

Designation: **PR WS-02A**  
Location:

Cover Type	Area, ac	CN	A x CN
Pavement/Roof	0.379	98	37.1032
Landscaped and Lawns	0.112	80	8.9219
	0.490		46.025

**Weighted CN: 94**

**Time of Concentration**

(computed in accordance with ConnDOT Drainage Manual, Sec. 6C)

Overland				
Segment	Surface "n"	Flow Length (ft.)	Slope (ft/ft)	Time (min.)
Segment A - B	0.24	45	0.195	2.98
Segment B - C	0.015	24	0.049	0.34

**Total Tc = 3.3 Min.  
5 (min) Min.**

Note: Overland time of concentration computed using "Kinematic Wave" equation  
Gutter and pipe time of concentration computed using Manning's equation

Project Name: **The Frederick Gunn School -  
Center for Innovation and Active Citizenship**  
Project Number: **G5012-002**  
Project Location: **Washington, CT**  
Description: **Proposed CN & Tc Calculations**  
Prepared By: **AVC** Date: **January 24, 2022**

Designation: **PR WS-02B**  
Location:

Cover Type	Area, ac	CN	A x CN
Pavement/Roof	0.076	98	7.4062
Landscaped and Lawns	0.060	80	4.7750
	0.135		12.1813

**Weighted CN: 90**

### Time of Concentration

(computed in accordance with ConnDOT Drainage Manual, Sec. 6C)

Overland				
Segment	Surface "n"	Flow Length (ft.)	Slope (ft/ft)	Time (min.)
Segment A - B	0.24	26	0.2	1.9

**Total Tc = 1.9 Min.**

Note: Overland time of concentration computed using "Kinematic Wave" equation  
Gutter and pipe time of concentration computed using Manning's equation

Designation: **PR WS-02C**  
Location:

Cover Type	Area, ac	CN	A x CN
Pavement/Roof	0.314	98	30.7836
Landscaped and Lawns	0.099	80	7.9376
	0.413		38.721

**Weighted CN: 94**

### Time of Concentration

(computed in accordance with ConnDOT Drainage Manual, Sec. 6C)

Overland				
Segment	Surface "n"	Flow Length (ft.)	Slope (ft/ft)	Time (min.)
Segment A - B	0.24	45	0.111	3.74

Shallow Concentrated Flow					
Segment	Slope (ft/ft)	V (ft/s)	Length (ft)	Time (min.)	
Segment B - C	paved	0.053	4.68	150	0.53

**Total Tc = 4.3 Min.**

Note: Overland time of concentration computed using "Kinematic Wave" equation  
Gutter and pipe time of concentration computed using Manning's equation

Tuesday, 01 / 25 / 2022

## Hyd. No. 6

### TO-INFILTRATION

Hydrograph type = Combine  
Storm frequency = 100 yrs  
Time interval = 2 min  
Inflow hyds. = 2, 3

Peak discharge = 5.105 cfs  
Time to peak = 12.07 hrs  
Hyd. volume = 16,980 cuft  
Contrib. drain. area = 0.625 ac

Tuesday, 01 / 25 / 2022

## Hyd. No. 7

### NORTHERN CHAMBERS

Hydrograph type	= Reservoir	Peak discharge	= 4.653 cfs
Storm frequency	= 100 yrs	Time to peak	= 12.10 hrs
Time interval	= 2 min	Hyd. volume	= 16,273 cuft
Inflow hyd. No.	= 6 - TO-INFILTRATION	Max. Elevation	= 695.62 ft
Reservoir name	= CHAMBERS	Max. Storage	= 1,437 cuft

Storage Indication method used. Exfiltration extracted from Outflow.

## Hyd. No. 9

WS2-TOTAL

Hydrograph type = Combine  
 Storm frequency = 100 yrs  
 Time interval = 2 min  
 Inflow hyds. = 4, 5, 8

Peak discharge = 8.015 cfs  
 Time to peak = 12.10 hrs  
 Hyd. volume = 30,620 cuft  
 Contrib. drain. area = 0.549 ac

Project Name: **The Ferederick Gunn School -  
Center for Innovation and Active Citizenship**  
Project Number: **G5012-002**  
Project Location: **Washington, CT**  
Description: **Water Quality Flow**  
Prepared By: **AVC** Date: **January 24, 2022**

## Water Quality Area 1 (WQA-1) Required Water Quality Volume (WQv)

Total Area in acres (A)	=	0.562
Impervious Area in acres	=	0.100
Pecent of Impervious Area (I)	=	18
Volumetric Runoff Coefficient (R)		

$$R = 0.05 + 0.009(I) = 0.210$$

$$WQv = \frac{(1")(R)(A)}{12} = 0.0098 \text{ ac*ft}$$
$$= \boxed{429 \text{ cf}}$$

*Calculated in accordance with the 2004 Connecticut Stormwater Quality Manual Sections 7.4.1 and 7.4.2*

## Water Quality Area 2A (WQA-2A) Required Water Quality Volume (WQv)

Total Area in acres (A)	=	0.491
Impervious Area in acres	=	0.070
Pecent of Impervious Area (I)	=	14
Volumetric Runoff Coefficient (R)		

$$R = 0.05 + 0.009(I) = 0.178$$

$$WQv = \frac{(1")(R)(A)}{12} = 0.0073 \text{ ac*ft}$$

$$= \boxed{318 \text{ cf}}$$

## Required Water Quality Flow (WQf)

WQv (Ac*ft)	=	0.0073
Drainage Area (Ac)	=	0.491

$$Q = WQv * 12 / DA = 0.178 \text{ in}$$

Runoff Depth in inches (Q)	=	0.178 in
Design Precipitation in inches (P)	=	1 in

$$CN = 1000 / [10 + 5 * P + 10Q - 10 * (Q^2 + 1.25QP)^{0.5}] = 85 \text{ CN}$$

From table 4-1 in chapter 4, TR-55

$$I_a = 0.353 \text{ in}$$

$$I_a / P = 0.353$$

From Exhibit 4-11 in chapter 4, TR-55

$$q_u = 550 \text{ csm/in}$$

Unit peak discharge in csm/in ( $q_u$ )	=	550
Area in square miles (A)	=	0.001
Runoff Depth in inches (Q)	=	0.178

$$WQF = q_u * A * Q = \boxed{0.075 \text{ cfs}}$$

## Water Quality Area 2B (WQA-2B) Required Water Quality Volume (WQv)

Total Area in acres (A)	=	0.136
Impervious Area in acres	=	0.045
Pecent of Impervious Area (I)	=	33
Volumetric Runoff Coefficient (R)		

$$R = 0.05 + 0.009(I) = 0.348$$

$$WQv = \frac{(1")(R)(A)}{12} = 0.0039 \text{ ac*ft}$$

$$= \boxed{172 \text{ cf}}$$

## Required Water Quality Flow (WQf)

WQv (Ac*ft)	=	0.0039
Drainage Area (Ac)	=	0.136

$$Q = WQv * 12 / DA = 0.348 \text{ in}$$

Runoff Depth in inches (Q)	=	0.348 in
Design Precipitation in inches (P)	=	1 in

$$CN = 1000 / [10 + 5 * P + 10Q - 10 * (Q^2 + 1.25QP)^{1/4}] = 91 \text{ CN}$$

From table 4-1 in chapter 4, TR-55

$$I_a = 0.198 \text{ in}$$

$$I_a / P = 0.198$$

From Exhibit 4-11 in chapter 4, TR-55

$$q_u = 625 \text{ csm/in}$$

Unit peak discharge in csm/in ( $q_u$ )	=	625
Area in square miles (A)	=	0.000
Runoff Depth in inches (Q)	=	0.348

$$WQF = q_u * A * Q = \boxed{0.046 \text{ cfs}}$$

# Available Models

CDS Model	Treatment Capacity <sup>3</sup> (cfs)	Maximum Sediment Storage Capacity (CF)
1515	1.0	26
w/ 1' added sump	1.0	33
w/ 2' added sump	1.0	40
w/ 3' added sump	1.0	47
2015_4	1.4	50
w/ 1' added sump	1.4	63
w/ 2' added sump	1.4	75
w/ 3' added sump	1.4	88
2015	1.4	79
w/ 1' added sump	1.4	98
w/ 2' added sump	1.4	118
2020	2.2	90
w/ 1' added sump	2.2	110
w/ 2' added sump	2.2	129
2025	3.2	97
w/ 1' added sump	3.2	117
w/ 2' added sump	3.2	136
3020	3.9	134
w/ 1' added sump	3.9	163
w/ 2' added sump	3.9	191
3030	6.1	157
w/ 1' added sump	6.1	185
w/ 2' added sump	6.1	213
4030	7.9	329
w/ 1' added sump	7.9	379
w/ 2' added sump	7.9	429
4040	12.4	381
w/ 1' added sump	12.4	431
w/ 2' added sump	12.4	482

1. Structure diameter represents the typical inside dimension of the concrete structure. Offline systems will require additional concrete diversion components
2. Depth below pipe can vary to accommodate site specific design. Depth below pipe invert represents the depth from the pipe invert to the inside bottom of concrete structure.
3. Treatment Capacity is based on laboratory testing using OK-110 (average d50 particle size of approximately 100 microns) and a 2400 micron screen.

Sediment Depths Indicating Required Servicing*			
CDS Model	Standard Sediment Depth (in.)	w/ 1' added Sump Sediment Depth (in.)	w/ 2' added Sump Sediment Depth (in.)
1515	18	27	36
2015_4	18	30	42
2015	18	30	42
2020	18	30	42
2025	18	30	42
3020	18	30	42
3030	18	39	42
4030	27	39	51
4040	27	39	51

\* Based on 75% capacity of isolated sump.
